

Nightly Path of December's Full Moon as Viewed from a Latitude of 45° South

As the night continues, the moon's angle with respect to the horizon appears to rotate. At midnight, it stands upright.

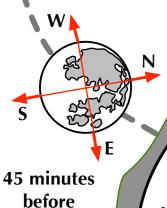

In December, the Full Moon sets in the west-northwest and is tilted so that its northeastern edge sets first.

West

In December, the Full Moon rises in the east-northeast and is tilted so that its southeastern edge rises first.
